# Green and Sustainable Remediation (GSR) Overview

Lindsay Burton  
Sustainable Remediation Forum (SURF) Secretary

[secretary@sustainableremediation.org](mailto:secretary@sustainableremediation.org)

# Who is SURF?

- The mission of SURF is to maximize the overall environmental, societal, and economic benefits from the site cleanup process by:
  - Advancing the science and application of sustainable remediation
  - Developing best practices
  - Exchanging professional knowledge
  - Providing education and outreach

# What we will cover

- Introduction to GSR
  - Regulatory History
  - Definitions
  - Principles
- “Green” versus “Green and Sustainable”
- Three Pillar Approach
  - Environmental Aspects
  - Social Impact Categories
  - Economic Metrics
- Case for Action

# GSR Resources

- SURF framework, guidance, and website
- ITRC GSR Overview and Framework
- ASTM Standard Guide for Incorporating Sustainable Objectives Into Cleanup

[www.sustainableremediation.org/remediation-resources/](http://www.sustainableremediation.org/remediation-resources/)

HOME ABOUT MEMBERSHIP WHY JOIN? SPONSORS CONTACT SURF SEARCH

**SURF**  
SUSTAINABLE REMEDIATION FORUM

## GREEN AND SUSTAINABLE REMEDIATION RESOURCES

- **SURF White Paper**  
Sustainable Remediation Forum (SURF), "Integrating sustainable principles, practices, and metrics into remediation projects", Remediation Journal, 19(3), pp 5 - 114, editors P. Hadley and D. Ellis, Summer 2009.
- **Green and Sustainable Remediation: State of the Science and Practice**  
ITRC Guidance Document to help educate and inform state regulators and other stakeholders in the concepts and challenges of GSR (May 2011).
- **Clu-In Green Remediation**  
Contaminated Site Cleanup Information
- **EPA Green Remediation Primer**  
Green Remediation: Incorporating Sustainable Environmental Practices into Remediation of Contaminated Sites
- **Superfund and Green Remediation**  
Green remediation information as it relates to the Superfund statutory and regulatory framework

### SITE RESOURCES

- member login
- member resources
  - student chapters
  - student chapter file upload
- online resources
  - remediation resources and guidance
  - tools and calculators
  - life cycle assessment
  - social and economic resources
  - water
  - energy
  - climate change and sustainability
  - regulatory agencies
  - professional organizations
  - research organizations
  - stakeholder coalitions
  - rating systems
  - standards and certification
  - international SURF affiliates

# Regulatory History

- Executive Order 13423 (2007)
- US EPA- Green Remediation: Incorporating Sustainable Environmental Practices into Remediation of Contaminated Sites (2008)
- Executive Order 13514 (2009)
- Department of the Navy Guidance on Green and Sustainable Remediation [NAVFAC] (2012)
- Executive Order 13693 (2015)

# Remediation

- **GOAL:** Reduce risks associated with site contamination
- **Footprint Effect Challenges:**
  - Uses natural resources
  - Generates emissions
  - Can generate waste materials
  - Introduces safety and health risks
- **Key Issue:** Remediation does not inherently benefit the environment, consequences of remedial actions must be considered when remediation considerations are made

# Differentiating

## Remedy Implementation n?

- **“Green” Remediation (US EPA; various documents)**
  - Practice of considering all environmental effects of remedy implementation and incorporating strategies to maximize net environmental benefit
  - The goal is not to change the remedy selection criteria but to incorporate sustainability into the process
  - Should not influence whether to remediate and may not influence technology selection but will influence how to implement remediation

## Remedy Selection?

- **“Green and Sustainable” Remediation**
  - Goes beyond Green Remediation...incorporates socio-economic considerations
  - The goal is to incorporate all 3 pillars of sustainability (environmental, social, economic) into the entire remedial action process in order to minimize impact and maximize value

# Definition

## **Green and Sustainable Remediation (GSR):**

- The practice of demonstrating, in terms of environmental, economic and social indicators, that the benefit of undertaking remediation is greater than its impact, and that the optimum remediation solution is selected through the use of a balanced decision-making process (Sustainable Remediation Forum - United Kingdom).
- Goes beyond traditional remediation...
  - Incorporates environmental, social and economic factors
  - Enhances benefits to human health and the environment
  - Improves stakeholder engagement
  - Identifies and prioritizes stakeholder values, focusing on the most critical for remedial alternative evaluations
  - Results in remedial actions that are comprehensive, implementable and effective

# Three Pillar Approach

Environmental
<ul style="list-style-type: none"><li>• Energy Use</li><li>• Emissions (including climate change)</li><li>• Impacts on Water</li><li>• Use of natural resources and generation of wastes</li><li>• Impacts on land and ecosystems</li><li>• Final Use</li></ul>

Social
<ul style="list-style-type: none"><li>• Impacts on human healthy and safety</li><li>• Ethical and equity considerations</li><li>• Impacts on neighborhoods or regions</li><li>• Community involvement and satisfaction</li><li>• Accident risk to site workers</li></ul>

Economic
<ul style="list-style-type: none"><li>• Project costs or benefits</li><li>• Employment and capital gain</li><li>• Other benefits (tax base, infrastructure development)</li></ul>

# Environmental Aspects

- Emissions to air
- Releases to water
- Releases to land
- Use of materials and resources
- Use of energy
- Energy emitted
- Generation of waste and/or by products
- Use of space

Source: ISO 14001

# Core Impact Categories

- Stakeholder engagement
- Health and Safety
- Benefits Community at Large
- Alleviate Undesirable Community Impacts
- Economic Vitality
- Social Justice
- Regional and Global Societal Impacts
- Value of Ecosystem Services & Natural Resources Capital
- Risk-Based Land Management & Remedial Solutions
- Contribution to Local and Regional Sustainability Policies & Initiatives

# Economic Metrics

- Local job generation/preservation
- Increased local community prosperity
- Poverty Reduction
- Creation of Community Assets
- Cost Effectiveness

# Application

2011

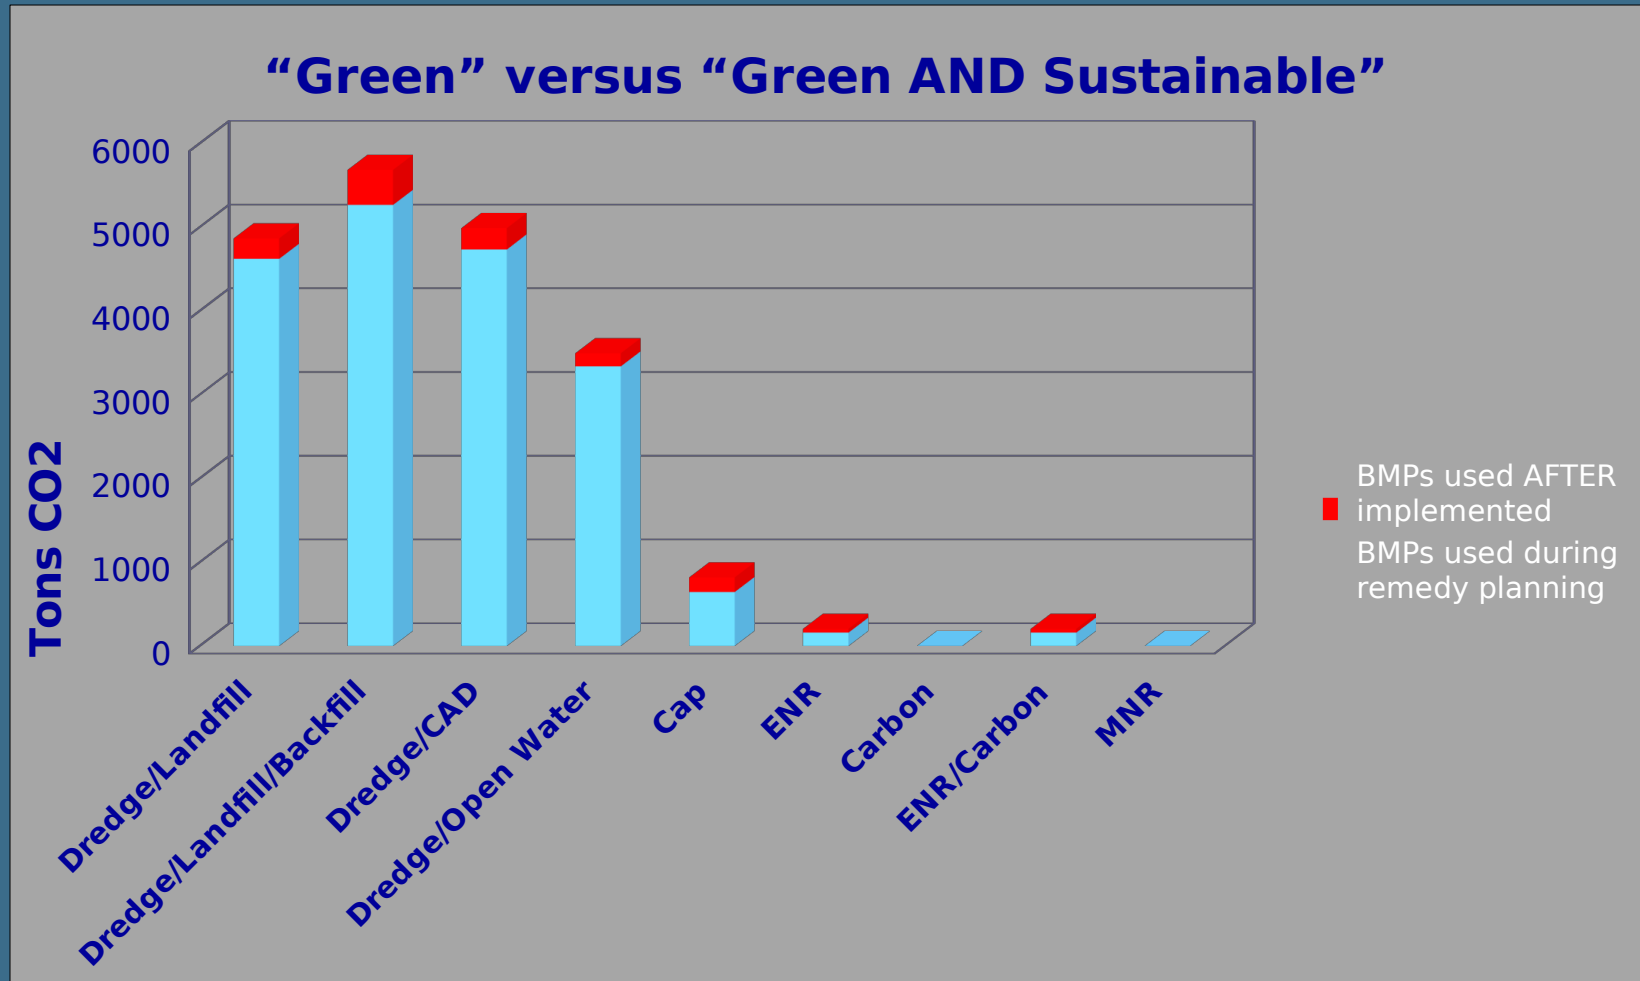

# BMP Implementation

Investigation	Remedy Evaluation and Selection	Remedial Design and Construction	Operations and Maintenance	Closure
---------------	---------------------------------	----------------------------------	----------------------------	---------

Primary Sustainability Pillar	BMP GSR Metric	Project Stage				
Environmental	Implement a telemetry system to reduce frequency of site visits.			X	X	
	Implement an idle reduction plan to reduce the amount of vehicle idling.	X	X	X	X	X
	Consider use of field screening methods (eg. Field test kits for contaminant screening) and on-site mobile laboratories to reduce resources and minimize laboratory analysis.	X	X		X	
Social	Develop templates of communication strategies for Project Manager use.	X	X	X	X	X
	Use a neutral party convener or facilitator for community engagement activities.	X	X	X		
	Consider selecting service providers, product supplies (e.g. cleanup products, safety supplies, work equipment, fuels/lubricants) and analytical laboratories from the local area and consolidate service and delivery schedules.	X	X	X	X	X
Economic	Determine short term and long term cost of site remediation alternatives contrasting with environmental and community benefits.	X	X	X		
	Consider providing the public training on sustainability (eg. implementing a local education program about site impacts and remediation impacts).	X	X	X	X	X
	Consider specific decision points for transition from one technology to another to limit the extent of remediation.		X	X		

# Case for Action

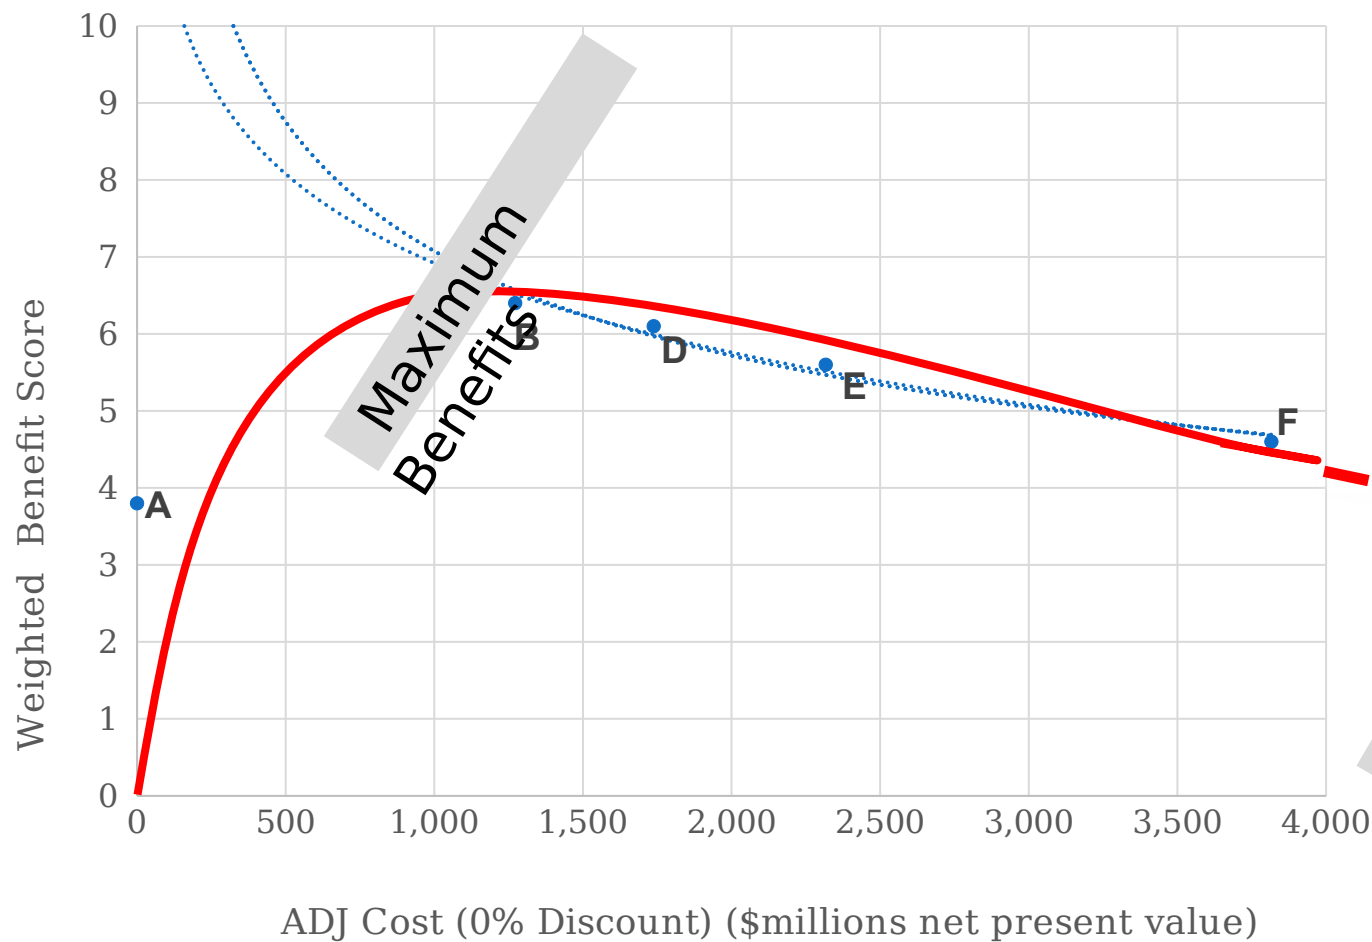

Reference: Lower Duwamish Waterway Feasibility Study (AECOM, 2012)

Note: Unit emissions are given for a 10 acre site with 5 feet contamination depth, 50% volume creep, transportation to and disposal at Roosevelt Landfill, 50% open water disposal, and 50% beneficial reuse. BMPs include finer tolerances, maximize rail use,
